

Standard Characterization of Protein Complexes

A. Author, B. Author (ScholarGuard synthetic evaluation set)

Abstract

We present analyses summarized in Figure 1 Figure 2. Cells were cultured under standard conditions and processed for analysis. Protein was extracted and separated by electrophoresis. Quantification was performed with standard densitometry software. Error bars represent mean $\pm$ SEM across independent replicates.

Methods

Cells were cultured under standard conditions and processed for analysis. Protein was extracted and separated by electrophoresis. Quantification was performed with standard densitometry software. Error bars represent mean $\pm$ SEM across independent replicates.

Results

Key findings are shown in Figure 1 Figure 2. Band intensities were quantified and compared across conditions. Cells were cultured under standard conditions and processed for analysis. Protein was extracted and separated by electrophoresis. Quantification was performed with standard densitometry software. Error bars represent mean $\pm$ SEM across independent replicates.
